PatientFlow — Hospital & Staff App: Complete Screen Outline

---

1. ONBOARDING & AUTHENTICATION

1.1 Splash Screen The app's loading screen. Displays the PatientFlow for Healthcare logo and a subtle tagline while the app initializes. Differentiated visually from the patient app to immediately signal a professional, clinical environment.

1.2 Welcome / Landing Screen The first screen a new facility or staff member sees. Two clear paths — *Register Your Facility* and *Staff Log In*. A brief line of context explaining that this platform is for verified healthcare providers only.

1.3 Facility Registration — Step 1: Facility Basics The facility name, type (hospital, clinic, diagnostic lab, pharmacy, specialist centre), physical address, country and city, primary contact number, and official email address. A field for the facility's registration or license number for verification purposes.

1.4 Facility Registration — Step 2: Facility Profile Number of beds (for hospitals), available departments and specialties (selectable from a master list with the option to add custom ones), operating hours per day of the week, and whether the facility offers emergency services, telemedicine, or both.

1.5 Facility Registration — Step 3: Admin Account Setup The person completing registration creates the primary administrator account. Full name, role, work email, phone number, and a password. This account has full administrative privileges and is responsible for adding other staff.

1.6 Facility Registration — Step 4: Verification & Submission An overview of all entered information before submission. The platform requires document upload for facility verification — operating license, accreditation certificate, and a government-issued ID for the registering admin. Submission triggers a review process. A confirmation screen explains that approval typically takes a set number of hours and that the admin will be notified by email.

1.7 Staff Log In Screen Email and password fields. Biometric login option for returning users. A *Forgot Password* link. A note that only staff added by a verified facility administrator can log in here — no self-registration for individual staff members.

1.8 First-Time Staff Setup Screen When a staff member logs in for the first time after being added by an admin, they are prompted to set their own password, confirm personal details, upload a profile photo, and review their assigned role and permissions before proceeding to the dashboard.

1.9 Forgot Password Screen Work email or phone input. Reset link or OTP sent. Leads to a Reset Password screen identical in function to the patient app equivalent.

1.10 Role Selection Screen *(for accounts with multiple roles)* If a user has been assigned more than one role — for example, a doctor who also has administrative privileges — they are presented with a role selector on login. Each role surfaces a different dashboard and permission set. Examples: *Attending Physician*, *Department Head*, *Administrator*, *Nurse*, *Front Desk*.

---

2. MAIN DASHBOARD

2.1 Administrator Dashboard The highest-level overview of the entire facility. Designed for hospital administrators and department heads. Key metrics displayed as summary cards at the top: total patients currently in the facility, number of patients waiting across all departments, total appointments scheduled for today, number of active doctors on shift, and current bed occupancy rate. Below the summary cards: a real-time patient flow chart showing arrivals, discharges, and current volume across departments over the last several hours. An urgent flags section showing any high-priority cases or system alerts requiring admin attention. Quick action buttons: *Add Staff Member*, *View Full Queue*, *Generate Report*, *Manage Departments*.

2.2 Doctor Dashboard Personalized to the individual doctor. Shows their appointment schedule for the day in a timeline view — each appointment showing the patient name, time slot, appointment type (in-person or telemedicine), and status (upcoming, checked in, in progress, completed). A *My Patient Queue* card showing who is currently waiting for them specifically. Active patient cases they are managing. Any pending tasks — lab results to review, prescriptions to sign off, follow-up notes to complete, or telemedicine consultations queued. Notifications specific to their patients.

2.3 Nurse / Clinical Staff Dashboard Focused on patient care tasks and ward activity. Shows the ward or department they are assigned to, the current list of patients in their care area, pending tasks (vitals to log, medications to administer, dressings due), and any urgent patient flags. A direct link to patient records and a quick-log tool for bedside data entry.

2.4 Front Desk / Reception Dashboard Built for patient-facing administrative staff. Shows the full day's appointment list, patients who have checked in and are waiting, patients who are expected but have not arrived, and a queue management interface. Quick access to patient registration, appointment booking on behalf of a patient, and the facility's current capacity status.

2.5 Notifications Panel Accessible from all dashboard types via a bell icon. A role-filtered list of all relevant alerts — new patient check-ins, appointment status changes, lab results returned, telemedicine session requests, urgent triage flags, system messages, and administrative alerts. Timestamped, tappable, and clearable. Critical alerts (e.g., emergency triage flags) are visually distinct with a red indicator.

---

3. PATIENT QUEUE & FLOW MANAGEMENT

3.1 Queue Overview Screen The master patient flow screen. A real-time, live-updating view of every patient currently in the facility organized by department. Each patient entry in the queue shows: patient name, check-in time, time waiting, assigned department, assigned doctor (if applicable), triage priority level (color-coded: red for urgent, amber for moderate, green for routine), and current status (waiting, in consultation, under observation, awaiting results, ready for discharge). Staff can update patient status directly from this screen.

3.2 Department Queue Screen A filtered version of the queue showing only patients within a specific department — e.g., the General Practice queue, the Emergency queue, or the Maternity queue. Department heads and nurses assigned to that department see this as their primary queue view. Drag-to-reorder functionality for manual priority adjustment when needed. Each patient card is tappable to open their record.

3.3 Triage Input Screen Used by triage nurses or front desk staff when a patient arrives. Captures the patient's presenting complaint, vital signs taken at arrival (temperature, BP, heart rate, oxygen saturation), pain score, and any immediately visible red flags. The AI triage engine processes this alongside any pre-submitted symptom data from the patient app and assigns a priority level. Staff can override the AI classification with a justification note.

3.4 AI Triage Result Screen Displays the AI-generated triage classification for a patient alongside the staff-entered data that informed it. Shows the priority level, the primary suggested care pathway (e.g., direct to emergency, general consultation, observation), and any red flag symptoms highlighted. The attending nurse or doctor reviews and confirms or overrides. All decisions — including overrides — are logged for clinical governance.

3.5 Patient Check-In Screen The screen used when a patient arrives at the facility for a scheduled appointment. Staff search for the patient by name, ID number, or appointment reference. The system confirms the appointment, prompts for any outstanding registration details, and checks the patient into the queue. For walk-in patients without an appointment, this screen initiates a new patient record or links to an existing one and places them in the walk-in queue for triage.

3.6 Walk-In Registration Screen For patients who arrive without a prior appointment. Staff capture or confirm the patient's basic details, reason for visit, and whether they are a new or returning patient. If new, a basic patient record is created. They are then sent through the triage flow before being placed in the appropriate queue.

3.7 Patient Status Update Screen A quick-action screen accessible from any patient queue entry. Staff update the patient's current status — moving them from *Waiting* to *In Consultation*, from *In Consultation* to *Awaiting Lab Results*, or flagging them as *Ready for Discharge*. Each status change is timestamped and reflected across all staff views in real time.

3.8 Bed & Room Management Screen For inpatient facilities. A visual layout of the ward showing all beds, their current status (occupied, available, being cleaned, reserved), and the patient assigned to each occupied bed. Staff can assign a patient to a bed, mark a bed as being cleaned after discharge, or flag a bed as out of service. Filters by ward or department.

3.9 Discharge Management Screen A list of all patients flagged as ready for discharge. Each entry shows the patient, their attending doctor, the ward they are in, and the time they were flagged for discharge. Staff use this screen to coordinate the final steps — confirming discharge instructions have been given, medications on discharge have been issued, and follow-up appointments have been scheduled. A final *Confirm Discharge* action that closes the patient's active encounter and updates bed availability.

---

4. APPOINTMENTS & SCHEDULING

4.1 Appointments Home Screen A full overview of the facility's appointment schedule. Defaults to today's view with a toggle for weekly and monthly views. Appointments are grouped by doctor and department. Each appointment card shows patient name, appointment type, time, and status. Color-coded by status: confirmed, checked in, in progress, completed, cancelled, no-show.

4.2 Calendar / Schedule View Screen A more visual calendar layout for scheduling. Staff can toggle between a daily, weekly, and monthly calendar. Each doctor's schedule is displayed as a colored column in the daily view. Tapping any time slot opens the appointment detail or a booking form for that slot.

4.3 Book Appointment on Behalf of Patient Screen Used by front desk or administrative staff to book an appointment for a patient directly — either a walk-in booking or a scheduled one. Staff search for or register the patient, select the relevant doctor or department, choose the date and time from available slots, select appointment type (in-person or telemedicine), and add any notes. A confirmation is sent to the patient via their registered contact.

4.4 Appointment Detail Screen Full details of a specific appointment — patient name and ID, doctor, department, date and time, appointment type, patient-submitted notes, triage information if pre-submitted, and current status. Action buttons vary by status: *Check In Patient*, *Start Consultation*, *Mark as No-Show*, *Reschedule*, *Cancel*.

4.5 Reschedule Appointment Screen Allows staff to reschedule an existing appointment. Shows the current appointment details, a date and time picker for the new slot, and a required reason for rescheduling. The patient is notified automatically upon confirmation.

4.6 Appointment Cancellation Screen Cancellation reason selection, optional free-text note, and confirmation. Automatically notifies the patient and frees the slot in the schedule.

4.7 Doctor Availability Management Screen Accessible by doctors themselves or administrators. Sets the doctor's regular working hours per day, recurring schedule blocks (e.g., ward rounds every Tuesday morning), and available slots for appointments and telemedicine. Doctors can block time for leave, procedures, or administrative work. Changes reflect immediately in the patient-facing booking system.

4.8 Appointment Analytics Screen A summary view of appointment data over a selected time period. Metrics include: total appointments, attendance rate, no-show rate, average wait

time from booking to consultation, and peak booking days and times. Filterable by doctor, department, or appointment type.

---

5. ELECTRONIC MEDICAL RECORDS (EMR)

5.1 Patient Search Screen The entry point for accessing any patient record. Staff search by patient name, national ID, date of birth, phone number, or PatientFlow patient ID. Search results show the patient's name, age, sex, and last visit date. Tapping a result opens their full record.

5.2 Patient Overview Screen The top-level view of a single patient's record. Divided into a header section (patient name, photo, age, sex, blood type, known allergies, primary conditions — always visible at the top) and a tabbed body with sections for Visit History, Diagnoses, Medications, Lab Results, Imaging, Vitals, and Discharge Summaries. A prominent alert banner if the patient has flagged allergies or critical conditions.

5.3 New Patient Registration Screen For patients being seen at the facility for the first time and who are not yet on the platform. Staff capture full name, date of birth, sex, contact number, address, national ID or insurance number, next of kin details, blood type, known allergies, and pre-existing conditions. If the patient later downloads the patient app and creates an account, their records are linked automatically via their phone number or ID.

5.4 Visit / Encounter Creation Screen When a consultation begins, the attending doctor opens a new encounter against the patient's record. The encounter is pre-populated with the appointment date, doctor, department, and any pre-submitted patient notes or triage data. The doctor then fills in the consultation from this screen.

5.5 Consultation Notes Screen The core clinical documentation screen used by doctors during and after a consultation. Structured into clearly labeled fields: *Chief Complaint*, *History of Presenting Illness*, *Review of Systems*, *Physical Examination Findings*, *Assessment / Impression*, *Plan*, and *Follow-Up Instructions*. Supports both typed and voice-to-text input. Auto-saves in real time. A quick-access sidebar shows the patient's allergy alerts, active medications, and last visit summary for reference during the consultation.

5.6 Diagnosis Screen A dedicated section within the encounter for recording diagnoses. Doctors search for and select diagnoses from a standardized code list (ICD-10 or equivalent) or enter a free-text clinical diagnosis. Multiple diagnoses can be added per encounter. Each diagnosis is tagged as *Primary*, *Secondary*, or *Differential*. Confirmed diagnoses are added to the patient's permanent diagnosis history.

5.7 Prescription Screen Used by doctors to issue prescriptions during or after a consultation. Search for a drug by name (branded or generic), select the form, dosage, frequency, route of administration, and duration. Add instructions for the patient (e.g., take with food). An automated interaction check runs against the patient's current medications and flags potential conflicts before the prescription is saved. Issued prescriptions are added to the patient's medication record and are visible on their patient app.

5.8 Lab Test Request Screen A screen for ordering diagnostic tests. Doctors search for and select tests from the facility's available test list (blood panel, urine analysis, imaging, microbiology, etc.). Each test request includes a clinical reason, urgency level (routine, urgent, stat), and any special instructions for the lab. Test requests are routed to the appropriate department in real time.

5.9 Lab Results Screen (Staff View) A list of all pending and returned lab results for patients under the doctor's or department's care. Each result entry shows the patient name, test name, ordered date, and result status (pending, partial, complete). Completed results display the values with reference ranges and a flagging system — critical results are highlighted immediately. Doctors review and sign off on results from this screen, and the result is then made available to the patient on their app.

5.10 Lab Result Detail Screen (Staff View) The full breakdown of a returned lab result. All individual markers, values, reference ranges, and automated flags for out-of-range values. A field for the doctor to add a clinical interpretation note that will be visible to the patient. A *Request Follow-Up Test* option and a *Notify Patient* toggle.

5.11 Imaging & Radiology Screen A list of imaging requests and returned reports for a patient or department. Supports viewing uploaded imaging files directly in-app. Radiologist report attached to each returned imaging request. Doctors can add a clinical interpretation note on top of the radiology report.

5.12 Vitals Logging Screen (Staff View) Used by nurses and clinical staff to log a patient's vitals at any point during their encounter — on arrival, during ward rounds, or at any clinical juncture. Fields for blood pressure, heart rate, temperature, oxygen saturation, respiratory rate, blood glucose, weight, and height. Each entry is timestamped and attributed to the logging staff member. All entries are appended to the patient's vitals history and visible across the care team.

5.13 Allergy & Alert Management Screen A dedicated screen within the patient record for managing allergy information and clinical alerts. Staff can add, edit, or remove allergy entries — each with the substance, reaction type, and severity. Clinical alerts (e.g., *Do Not Resuscitate order*, *Requires interpreter*, *High fall risk*) can also be set here. These flags are prominently displayed on every screen where the patient's record appears.

5.14 Patient History Screen A comprehensive, read-only chronological log of the patient's entire medical history on the platform — every visit, diagnosis, prescription, test, and clinical note across all facilities they have been seen at (with appropriate access permissions). Searchable and filterable by date, facility, or record type.

5.15 Discharge Summary Creation Screen Completed by the attending doctor at the end of an inpatient stay. Structured fields for: admission date and reason, summary of clinical course, procedures performed, diagnoses at discharge (primary and secondary), medications on discharge (auto-populated from prescriptions with option to modify), condition at discharge, follow-up plan, and any patient instructions. Once completed and signed off, the discharge summary is added to the patient's permanent record and pushed to their patient app.

5.16 Referral Management Screen A tool for creating and managing patient referrals to other specialists or facilities. The referring doctor selects the patient, the specialty or specific doctor being referred to, the reason for referral, and the urgency. Relevant records (current diagnosis, medications, recent results) are attached to the referral. If the receiving doctor or facility is also on the platform, the referral is delivered directly and the patient is notified. Outgoing and incoming referrals are both tracked here.

5.17 Record Access Log Screen An audit trail showing every instance of a patient's records being accessed — who accessed them, when, from which device, and what action was taken (viewed, edited, exported). Accessible by administrators and by the patient via their own app. Supports clinical governance and data protection compliance.

---

6. TELEMEDICINE PLATFORM (STAFF SIDE)

6.1 Telemedicine Dashboard Screen An overview of all telemedicine activity for the facility. Shows scheduled consultations for the day, on-demand consultations currently in the queue, active calls in progress, and completed consultations. Filterable by doctor. A *Go Available* toggle for doctors to mark themselves as available for on-demand consultations.

6.2 Telemedicine Queue Screen A live queue of patients waiting for an on-demand consultation. Each entry shows the patient name, reason for visit (from their submitted notes), waiting time, and triage priority if pre-assessed. Doctors pick the next patient from the queue or are automatically assigned based on specialty and availability.

6.3 Pre-Consultation Preparation Screen Before joining a call, the doctor sees the patient's submitted consultation notes, relevant medical history highlights, active medications, and allergy alerts. A *Join Call* button. This gives the doctor the context they need before the session begins.

6.4 Active Telemedicine Consultation Screen The in-call interface for the doctor. Video feed, microphone and camera controls, end call button. A side panel showing the patient's key record highlights. A live note-taking field that will become the consultation note. A quick prescription tool accessible without leaving the screen. A *Share Screen* or *Send to Patient* option for sharing documents or instructions during the call.

6.5 Post-Consultation Documentation Screen After the call ends, the doctor completes the encounter record — confirming or expanding the consultation notes taken during the call, finalizing any diagnosis, issuing prescriptions, ordering any tests, and setting follow-up instructions. This mirrors the Consultation Notes screen (5.5) but is post-call rather than in-person. All entries are saved to the patient's EMR.

6.6 Telemedicine Consultation History Screen A log of all telemedicine consultations conducted through the facility — searchable by patient, doctor, or date range. Each entry links to the full consultation record. Useful for clinical audit and follow-up management.

---

7. STAFF MANAGEMENT

7.1 Staff Directory Screen A searchable list of all staff registered under the facility. Each staff card shows name, role, department, contact number, and active status (on shift, off shift, on leave). Tapping a staff card opens their full profile. Filterable by role, department, or shift status.

7.2 Staff Profile Screen Full details of an individual staff member. Name, photo, role, department, qualifications (for clinical staff), license number, contact information, assigned working hours, and account status. For doctors, links to their appointment schedule and telemedicine availability. Admins can edit details, change roles, or deactivate accounts from here.

7.3 Add New Staff Member Screen An administrator-only screen. Enter the new staff member's name, work email, phone number, and assigned role (Doctor, Nurse, Front Desk, Lab Technician, Radiologist, Pharmacist, Administrator, or custom role). Select their department and set their permission level. The staff member receives an invitation to set up their account. Bulk invite option via CSV upload for onboarding multiple staff at once.

7.4 Role & Permissions Management Screen Defines what each role can access and do within the app. Administrators can view and customize permission sets for each role — for example, restricting prescription creation to doctors only, or limiting access to financial reports to senior administrators. Changes to permissions apply immediately across all accounts with that role.

7.5 Shift & Schedule Management Screen A scheduling tool for managing staff shifts. Displays a weekly calendar with staff shifts color-coded by role. Admins can add, edit, or remove shifts, assign staff to specific wards or departments for each shift, and manage leave requests. The system flags scheduling gaps — for example, if a department would have no doctor on shift during a given period.

7.6 Leave Management Screen Staff submit leave requests from this screen. They select the leave type (annual, sick, emergency, study), the date range, and add an optional note. Administrators review, approve, or decline requests. Approved leave automatically updates the staff member's availability in the appointment and telemedicine systems.

7.7 Staff Performance Overview Screen *(Admin only)* An aggregated view of activity metrics per staff member over a selected time period. For doctors: number of consultations, average consultation duration, telemedicine sessions, and prescription volume. For nurses: vitals logged, tasks completed. For front desk: patients checked in, average wait time managed. Not a judgment tool — intended for workload management and resource planning.

---

8. ANALYTICS & REPORTING

8.1 Analytics Home Screen The facility's data command centre. A summary dashboard of the most critical operational metrics for the current period — patient volume, average wait

time, appointment fulfillment rate, bed occupancy rate, discharge rate, and telemedicine utilization. Each metric card is tappable for a deeper breakdown.

8.2 Patient Flow Analytics Screen Detailed analysis of how patients move through the facility. Metrics include: average time from check-in to triage, triage to consultation, consultation to results, and results to discharge. Bottleneck identification — which stages or departments consistently cause delays. Trend lines over time to show whether flow is improving or deteriorating.

8.3 Appointment Analytics Screen Volume of appointments over time, breakdown by type (in-person vs telemedicine), no-show and cancellation rates, peak booking days and hours, and average lead time between booking and appointment date. Filterable by doctor and department.

8.4 Department-Level Analytics Screen A drilldown into metrics for a specific department. Patient volume, average wait time, staff-to-patient ratio, most common diagnoses seen, test request volume, and referral rates in and out. Department heads can use this to identify resource needs and optimize department-level workflows.

8.5 Clinical Analytics Screen An aggregated, de-identified view of clinical data across the facility. Most frequently diagnosed conditions, most prescribed medications, lab test request patterns, and referral trends. Used for clinical governance, resource planning, and identifying population health trends within the patient base.

8.6 Telemedicine Analytics Screen Usage metrics for the telemedicine platform. Total consultations, on-demand vs scheduled breakdown, average waiting time in the virtual queue, consultation duration averages, patient satisfaction scores (if collected post-call), and top reasons for virtual visits.

8.7 Report Generation Screen A tool for generating and exporting formal reports. Administrators select the report type (daily activity summary, monthly patient flow report, appointment report, EMR audit report, staff productivity overview), the date range, the scope (whole facility, specific department, or specific doctor), and the output format (PDF, CSV, or in-app view). Reports can be scheduled to generate and email automatically on a recurring basis.

---

9. NOTIFICATIONS & COMMUNICATIONS

9.1 Notifications Centre Screen A comprehensive, role-filtered notification hub. Clinical staff see patient alerts, lab result returns, consultation reminders, and triage flags. Administrators see system alerts, staff activity notifications, and facility-level operational updates. All notifications are timestamped, categorized, and tappable to the relevant screen. Persistent critical alerts remain pinned until acknowledged.

9.2 Internal Messaging Screen A secure, HIPAA-conscious internal messaging tool for communication between staff within the facility. Supports one-to-one and group conversations. Messages can be tagged to a specific patient record for clinical context (e.g.,

"re: Patient [ID]"). File and document sharing supported. Not a general-purpose chat — intended strictly for clinical and operational communication.

9.3 Message Thread Screen The individual conversation view within internal messaging. Standard messaging interface with text, file attachment, and patient record tagging. Messages are logged and accessible for clinical audit purposes.

9.4 Patient Communication Screen A controlled tool for sending messages or notifications directly to patients through the platform. Used for appointment reminders, test result notifications, pre-appointment instructions, and post-visit follow-up messages. Messages sent here appear in the patient's notification panel on their app. Bulk messaging option for facility-wide announcements (e.g., service changes, holiday hours).

---

10. FACILITY SETTINGS & ADMINISTRATION

10.1 Facility Profile Screen The facility's public-facing and internal profile. Name, type, address, operating hours, contact details, list of departments and specialties, and facility photos. Administrators can edit all fields. Changes to publicly visible information (e.g., operating hours) update the facility's listing on the patient-facing locator in real time.

10.2 Department Management Screen A list of all departments configured for the facility. Each department entry shows the department name, head of department (linked to their staff profile), number of staff assigned, and whether it is active or inactive. Admins can add new departments, edit existing ones, or deactivate departments that are no longer operational.

10.3 Service Configuration Screen Defines what services the facility offers on the platform — in-person appointments, telemedicine, emergency services, specific diagnostic tests, and pharmacy services. Toggling a service on or off affects its visibility to patients on the patient app. Each service can have associated fees configured here.

10.4 Appointment Slot Configuration Screen Sets the facility's standard appointment slot duration, the maximum number of simultaneous appointments per doctor, and any department-specific scheduling rules. Administrators can also configure blackout periods — dates when the facility or specific departments are not taking appointments (e.g., public holidays, planned maintenance).

10.5 EMR Configuration Screen Allows administrators to customize the EMR fields and templates used by their facility. Facilities can add custom fields to consultation notes, create department-specific note templates, and configure which sections are mandatory vs optional for their clinical workflows.

10.6 Billing & Insurance Configuration Screen Sets up the facility's fee structure within the platform — consultation fees by doctor or department, telemedicine rates, and lab test fees. Configures accepted insurance providers and their associated claim codes. This data informs the fee display on the patient-facing booking screens.

10.7 Integration Settings Screen For connecting PatientFlow with the facility's existing systems — laboratory information systems, radiology systems, pharmacy management systems, or legacy EMR platforms. Administrators manage API connections, data sync settings, and integration status from this screen.

10.8 Data & Compliance Screen Facility-level data governance controls. Administrators set data retention policies, manage consent configurations, access the full facility-wide audit log, and review compliance status against relevant local health data regulations. Includes an option to request a full data export for the facility.

10.9 Subscription & Plan Screen *(if applicable)* Shows the facility's current plan tier, the features included, usage metrics relative to plan limits, and options to upgrade, downgrade, or manage billing details. For facilities on the free tier, this screen shows what is available and what unlocks at higher tiers.

---

11. PROFILE & PERSONAL SETTINGS (Per Staff Member)

11.1 Personal Profile Screen Each staff member's own profile view. Name, photo, role, department, contact details, and professional qualifications. Option to edit personal details and upload a profile photo. For doctors, this profile is also their public-facing profile visible to patients booking telemedicine consultations.

11.2 My Schedule Screen The staff member's personal view of their own schedule — today's appointments, upcoming shifts, leave status, and telemedicine availability. Links directly to the appointment and telemedicine management screens relevant to them.

11.3 Security Settings Screen Change password, biometric login toggle, active session management (view and revoke other logged-in devices), and two-factor authentication setup.

11.4 Notification Preferences Screen Granular controls for the types of notifications the staff member receives — patient alerts, appointment reminders, lab result notifications, internal messages, and administrative updates. Toggle between push, SMS, or email per category.

11.5 Language & Accessibility Screen App language selection, text size controls, high-contrast mode, and screen reader settings.

11.6 Help & Support Screen FAQs for healthcare staff, a support ticket submission tool, live chat access for urgent platform issues, and a library of staff-facing training guides and feature walkthroughs.

11.7 About & Legal Screen App version, terms of service, privacy policy for healthcare providers, data processing agreement details, and platform contact information.

---

12. ADDITIONAL UTILITY SCREENS

12.1 Global Search Screen A platform-wide search accessible from all dashboards. Searches across patient records, staff profiles, appointments, and reports. Results are categorized. Patient search results respect role-based access — a front desk user cannot access clinical notes, for example.

12.2 Offline / Limited Connectivity Screen A fallback screen for when the device loses internet connection. Displays the last synced queue data and appointment schedule where cached data is available. A clear indicator of which actions require connectivity and a prompt to reconnect. Any entries made offline (e.g., vitals logged during a network outage) are queued and synced automatically when connection is restored.

12.3 Error & Empty States Consistent, professional empty states across all screens — e.g., *"No patients in queue"*, *"No lab results pending"* — with relevant action prompts. Error screens for failed data loads with retry options and a link to support.

12.4 Onboarding Walkthroughs Role-specific guided walkthroughs shown on first login. Administrators get a tour of the facility setup and staff management tools. Doctors get a walkthrough of the patient queue, EMR, and telemedicine features. Front desk staff get a guide through check-in, the queue overview, and appointment management. All walkthroughs can be re-accessed from the Help screen.

12.5 System Status Screen A live status page showing the operational health of the platform's key services — patient queue sync, EMR, telemedicine engine, lab result integration, and notification delivery. If any service is degraded, the specific impact is clearly explained here alongside an estimated resolution time.
